

# Vaccine Side Effects

Your pet received vaccinations today. Most animals do not have a negative reaction to vaccinations. However, here are a few things to be aware of that are considered common side effects:

- Lethargy (sleepiness)
- Decreased appetite
- Limping and/or soreness at the vaccination site
- Antisocial behaviors
- Small swelling at/around the vaccination site

If any of these symptoms persist for more than 48 hours, please contact your local veterinarian. Any follow-up care must be handled by your local veterinarian and cannot be handled by HSPPR.

The following symptoms are considered abnormal/severe and require immediate veterinary attention. All medical care will be at your expense.

- Lethargy combined with fever
- Vomiting/diarrhea
- Prolonged decreased appetite
- Facial swelling/severe itching/hives
- Any difficulty breathing

You must seek veterinary care if there are any reactions you are concerned about. Please bring your vaccination record with you. Any follow-up care must be handled by your local veterinarian and cannot be handled by HSPPR.
